# Code hidangan

Controller hidangan fungsi index untuk menampilkan objek data berisikan APIHIDANGAN ke view hidangan

## View hidangan

Fungsi untuk tambah data hidangan berupa fungsi addHidangan dan setSave

View js untuk tambah data hidangan. Gambar dibawah ini merupakan bagian validasi form sebelum di simpan

```
Client > application > views > admin > hidangan > 🐡 v_hidangan_add.php
                   let lbl_menu = document.getElementById("lbl_menu");
                   let txt_menu = document.getElementById("txt_menu");
                   let err_menu = document.getElementById("err_menu");
                  let lbl_deskripsi = document.getElementById("lbl_deskripsi");
                   let txt_deskripsi = document.getElementById("txt_deskripsi");
                  let err_deskripsi = document.getElementById("err_deskripsi");
                  let lbl_harga = document.getElementById("lbl_harga");
                  let txt_harga = document.getElementById("txt_harga");
                   let err_harga = document.getElementById("err_harga");
                   // untuk aktif
                  let lbl_aktif = document.getElementById("lbl_aktif");
                  let cbo_aktif = document.getElementById("cbo_aktif");
                   let err_aktif = document.getElementById("err_aktif");
                  if (txt_menu.value === "") {
                       err_menu.style.display = "unset";
                       err_menu.innerHTML = "Menu Harus Di Isi";
lbl_menu.style.color = "#FF0000";
                       txt_menu.style.borderColor = "#FF0000";
                       err_menu.style.display = "none";
                       err_menu.innerHTML = "";
                       lbl_menu.style.color = "unset";
                       txt_menu.style.borderColor = "unset";
```

Lalu fungsi setSave akan mengeksekusi jika objek validasi terpenuhi pada gambar diatas

```
// arrow function
const setSave = (menu, deskripsi, harga, aktif) => {
    // buat variabel untuk form
    // bisa untuk mengupload file
    let form = new FormData();

    // isi / tambah nilai untuk form
    form.append("menuhidangan", menu);
    form.append("deskhidangan", deskripsi);
    form.append("hargahidangan", harga);
    form.append("aktifhidangan", aktif);

    // proses kirim data ke controller
    fetch('<?php echo site_url("Hidangan/setSave"); ?>', {
        method: "POST",
        body: form
    })
    .then((response) => response.json()) // response json dari hidangan
    .then((result) => alert(result.statusnya))
    .catch((error) => alert("Data Gagal Dikirim!"))
}
```

### Fungsi untuk update hidangan

## setUpdate adalah fungsi terakhir untuk mengupdate data hidangan

# Fungsi untuk menghapus data hidangan pada controller Hidangan

```
function setDelete()

function setDelet
```

## Fungsi javascrip pada view hidangan untuk menghapus data hidangan
